

Report Refresh and Distribution Using Macros

For the reporting workbooks themselves, consultants could record and create a suite of VBA macros to automate all steps like:

- 
 Refreshing data sources and updating all values across worksheets
- 
 Adjusting chart ranges and resizing to the latest data
- 
 Importing calculated values/commentary updates from linked files
- 
 Creating report copies in PDF format for distribution
- 
 Sending out scheduled emails with reports as attachments

With these macros, what previously took days of effort can now be accomplished with a few clicks, massively accelerating the consultants' analysis and reporting capabilities.
