

Client (Customer) Analytics

Client or customer analytics focuses on using data and analytical techniques to gain valuable insights about customer behaviour, preferences, and experiences. This can include areas like:

Customer segmentation and profiling

Grouping customers based on shared characteristics (demographics, buying patterns, etc.) to understand different segments better.

Churn prediction and retention strategies

Analysing data to identify customers at risk of leaving (churning) and developing strategies to retain them.

Customer lifetime value analysis

Estimating a customer's total revenue over their lifetime relationship with the company.

Sentiment analysis and voice of the customer

Using techniques like natural language processing to understand customer opinions, satisfaction levels, and feedback from sources like reviews or social media.

Personalisation and recommendation engines

These provide personalised product or content recommendations to individual customers based on their preferences and behaviour.
