

Operations Analytics

Operations analytics optimise and streamline various business processes and operations using data-driven approaches. Examples include:

Supply chain optimisation and logistics planning: Analysing data to optimise transportation routes, inventory levels, warehousing, and distribution for efficiency and cost savings.

Inventory management and demand forecasting: Using historical data and predictive models to forecast future product demand and plan inventory levels accordingly.

Predictive maintenance and asset management: Monitoring equipment and asset data to predict when maintenance will be required, reducing downtime and unexpected failures.

Resource allocation and workforce planning: Analysing workloads, skills availability, and other factors to optimally allocate staff and resources across projects or operations.

Process mining and bottleneck identification: Visualising and analysing process data flows to identify inefficiencies, bottlenecks, and opportunities for process improvements.
