

Sustainability and Circular Economy

Increasing environmental concerns have prompted manufacturers to adopt sustainable practices, such as reducing waste, minimising energy consumption, and exploring circular economy models prioritising resource efficiency and product life cycle management.

Circular Economy

Additive Manufacturing (3D Printing)

Additive manufacturing technologies have disrupted traditional manufacturing methods, enabling on-demand production, customisation, and reduced lead times. This trend has significant implications for supply chain management, product design, and inventory management.

3D Printing thrives where fixed cost is low but variable cost is high. Parts which need to be produced in very limited quantities are a potential candidate for 3D Printing. This technology existed but has become cheaper after the expiry of patents
