IKEAs supply chain

Project Execution - 2

Throughout the engagement, the consulting firm implemented various supply chain optimisation strategies, including:

Network redesign

Transportation optimisation

Inventory management
improvements

Technology enhancements

Continuous improvement methodologies
were employed to identify and address:

Bottlenecks

Inefficiencies

Opportunities for further optimisation

Regular progress reviews and course
corrections were made based on:

Performance
data

Client stakeholder
feedback

Outcome

After 18 months, the engagement achieved
the following results:

- Supply chain costs reduced by 18%
(exceeding the 15% target)
- On-time delivery performance
improved by 12 percentage points
(exceeding the 10% target)
- Customer satisfaction scores increased
by 25% (exceeding the 20% target)

The consulting firm received performance-
based fees and bonuses for exceeding the
targets, aligning their compensation with
the value delivered to the client.

The gain-sharing model further incentivised
the consulting firm, as they received a
percentage of the cost savings achieved for
the client.

The client was delighted with the tangible
results and the collaborative partnership
fostered throughout the engagement.

This case study demonstrates the power of outcome-based pricing models in driving measurable results and fostering a true partnership between the consulting firm and the client. Both parties were motivated to achieve exceptional outcomes by aligning incentives and promoting accountability, leading to a successful and mutually beneficial engagement.
