

Key Components and Modules of an ERP System

While the specific modules and functionalities may vary depending on the ERP solution and the organisation's needs, most ERP systems typically include the following core components:

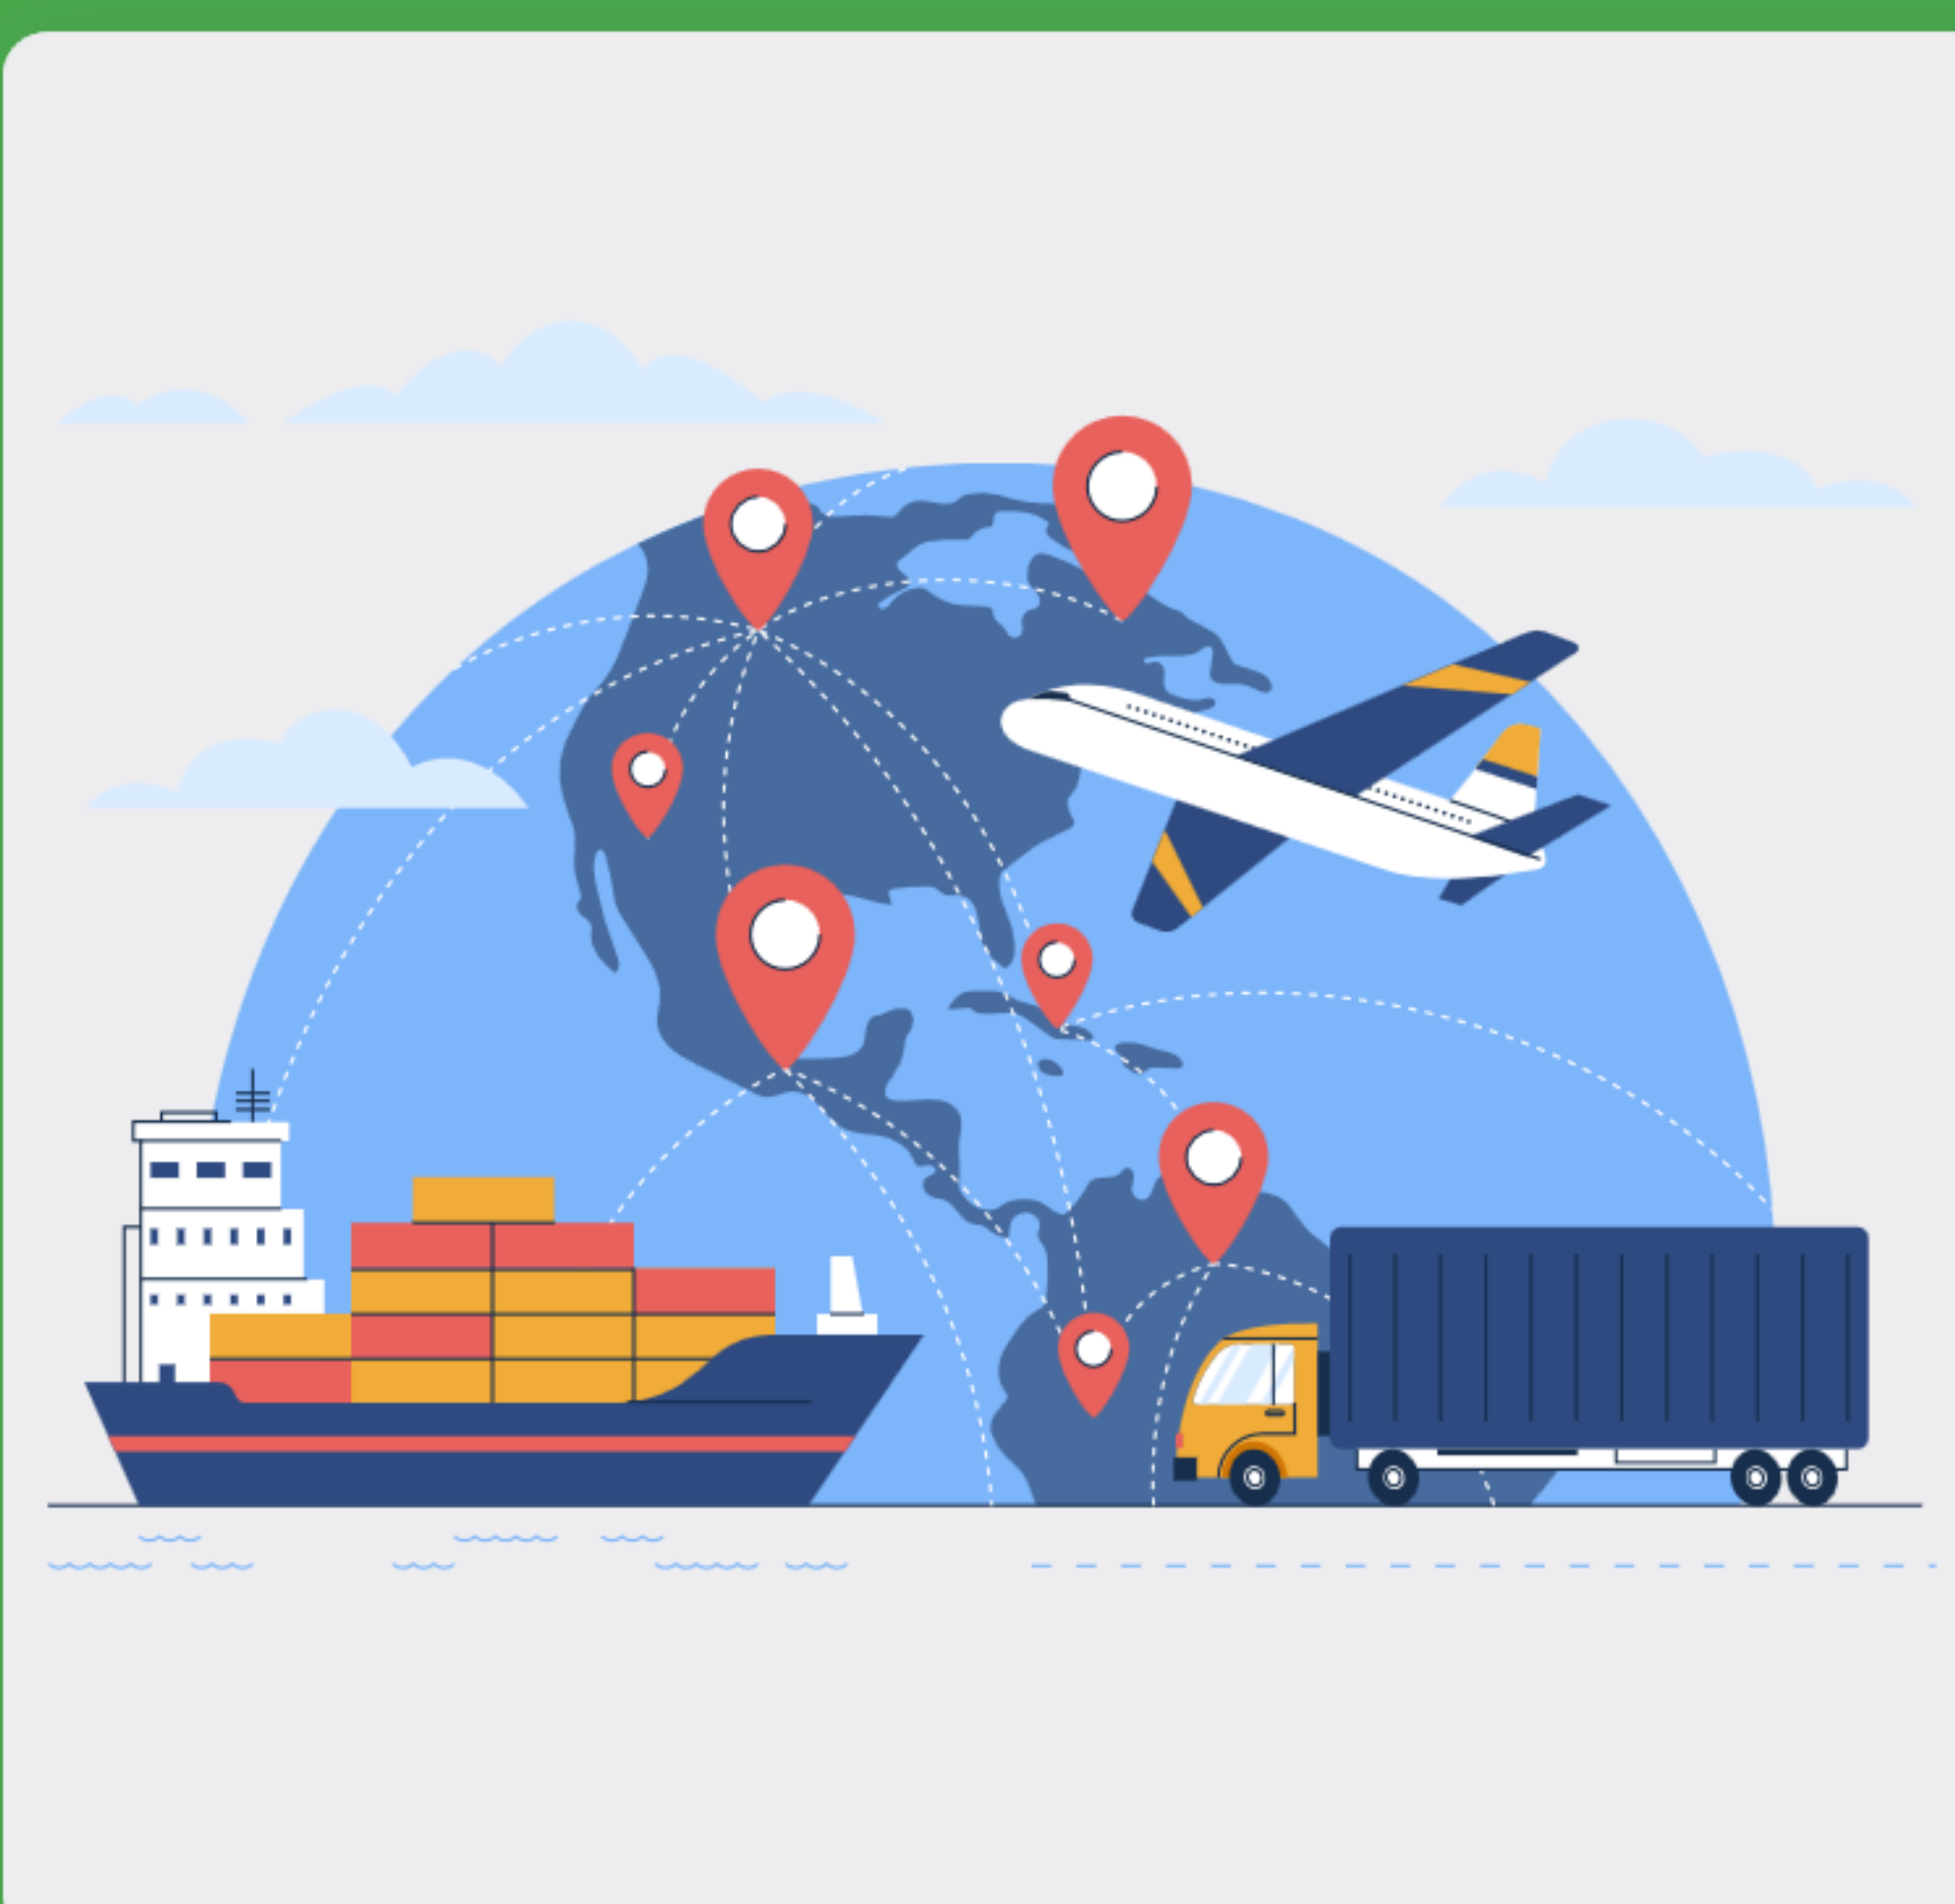

Financial Management

This module handles all financial transactions, including accounts payable, accounts receivable, general ledger, and financial reporting. It provides a comprehensive view of the organisation's economic health and supports informed decision-making regarding budgeting, forecasting, and financial planning.

Human Resources (HR) Management

The HR module manages all aspects of employee life cycle management, including recruitment, onboarding, payroll, benefits administration, performance management, and training and development. It streamlines HR processes and ensures compliance with labour laws and regulations.

Supply Chain Management

This module oversees the entire supply chain process, from procurement and inventory management to logistics and distribution. It optimises inventory levels, manages supplier relationships, and facilitates efficient order fulfilment.
