

Customer Relationship Management (CRM)

The CRM module enables organisations to manage customer interactions, track sales activities, and analyse customer data. It supports lead generation, opportunity tracking, and customer service, ultimately enhancing customer satisfaction and loyalty.

Manufacturing and Production Planning

For organisations involved in manufacturing, the ERP system typically includes modules for production planning, material requirements planning (MRP), shop floor control, and quality management. These modules help optimise production processes, ensure efficient resource utilisation, and maintain product quality.

Business Intelligence and Analytics

Many modern ERP systems incorporate business intelligence (BI) and analytics capabilities, enabling organisations to gain valuable insights from their data. This module provides data visualisation, reporting, and advanced analytics tools, supporting informed decision-making and strategic planning.
