# Defining Problems and Scope

Having explored the importance of data organisation, let's take a closer look at how consultants define problems and scope out their engagements.

## Understanding Client Objectives

The first step in any consulting project is understanding the client's goals and objectives.

What are they trying to achieve?

What are their pain points and challenges?

## Stakeholder Analysis

Consultants must identify all stakeholders involved in the project and understand their needs, concerns and expectations.

## Problem Identification and Framing

Once the problem is understood, consultants must define it in a way that is clear, concise, and actionable. This involves breaking down the problem into its key components and framing it in a way that guides the consulting engagement.
