ERP Customisation and Configuration: Tailoring ERP Solutions to Meet Specific Business Processes

Enterprise Resource Planning (ERP) systems are designed to integrate various business processes and functions within an organisation. However, each business has unique requirements, and a one-size-fits-all approach may not be suitable.

This is where ERP customisation and configuration come into play, allowing businesses to tailor the ERP solution to meet their specific needs. Customisation and configuration are crucial aspects of ERP implementation, as they ensure that the system aligns with the organisation’s existing processes, workflows, and industry-specific requirements.
