

Another critical configuration aspect is setting up the rules and parameters for various business processes within the ERP system. This could include defining approval workflows, setting pricing rules, configuring inventory management policies, or establishing procurement protocols. By configuring these processes within the ERP system, organisations can streamline operations, enforce consistency, and ensure adherence to established policies and procedures.

Setting up rules and parameters for various business processes

Defining approval workflows

Setting pricing rules

Configuring inventory management policies

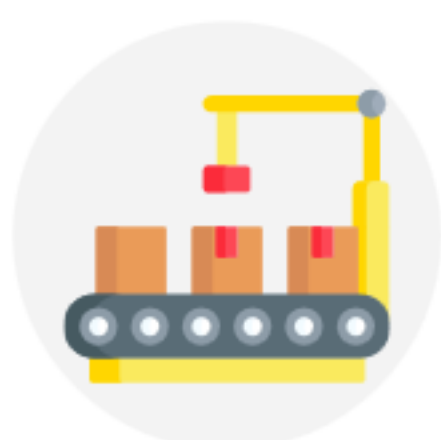

Establishing procurement protocols

Configuration also involves tailoring the ERP system to support industry-specific requirements or unique business models. For instance, a manufacturing company may require specific configurations for production, material requirements planning (MRP), and quality control processes. At the same time, a retail organisation may need configurations for inventory management, point-of-sale systems, and omnichannel operations.

Manufacturing Company

A manufacturing company may require specific configurations for:

Production

Material Requirement Planning MRP

Quality Control Processes

Retail Organisation

A retail organisation may need configurations for:

Inventory Management

Point-of-sale systems

Omnichannel Operations
