

Balancing Customisation with Standardisation

A general rule of thumb is to aim for a fit rate of at least **70%** between the organisation’s business processes and the ERP system’s out-of-the-box functionality.

If the fit rate falls below 70%, meaning more than **30%** customisation is required, it may be advisable to re-evaluate the chosen ERP system or consider revising the business processes.

Organisations should carefully analyse their business processes and prioritise customisation efforts based on must-have, good-to-have, and nice-to-have requirements. By focusing on essential customisations initially and implementing them in phases, organisations can balance customisation and standardisation, ensuring a successful ERP implementation while minimising risks and potential challenges.

It is crucial to involve key stakeholders, subject matter experts, and end-users throughout the customisation and configuration process. Conducting workshops, gathering requirements, and obtaining feedback from those using the system daily can help identify potential gaps or areas for improvement, ensuring that the customised or configured ERP system aligns with the organisation’s unique needs and operational realities.
