Change Management and Training

Managing Organisational Change During ERP

Implementing an Enterprise Resource Planning (ERP) system is a transformative endeavour that impacts an organisation’s processes, workflows, and daily tasks.

Effective change management and training are critical components of a successful ERP implementation, as they help organisations navigate the complexities of organisational change and ensure user adoption and proficiency with the new system.

Overcoming Resistance to Change

Introducing a new ERP system often faces resistance from employees, who may be comfortable with the existing systems and processes. This resistance can stem from various factors, including fear of the unknown, perceived loss of control or power, or concerns about job security.

Ignoring or underestimating this resistance can lead to a lack of user adoption, decreased productivity, and a failed ERP implementation.

Using existing system

I like Windows 7

Introduction of new system

I don't want to use Windows 11
