

Providing Training and Support for Users

Practical training is a cornerstone of successful ERP implementation and user adoption. A well-designed training program should be tailored to the specific needs of different user groups and delivered through a blended approach that combines various learning methods.

Role-Based Training: Training should be tailored to different user groups' specific organisational roles and responsibilities. For example, finance users may require in-depth training on financial modules, while sales representatives may need focused training on customer relationship management (CRM) and order management functionalities.

Blended Learning Approach: A blended learning approach that combines instructor-led training, e-learning modules, hands-on simulations, and job aids can cater to different learning styles and preferences, improving knowledge retention and application.

Training Environment: A realistic training environment that mirrors the live ERP system can help users gain practical experience and familiarity with the new system before going live. This can be achieved through sandboxes or dedicated training instances of the ERP system.

Continuous Learning: ERP systems are complex and constantly evolving. Providing ongoing training opportunities, such as refresher courses, advanced training, and knowledge-sharing sessions, can help users stay current and maximise the ERP system's value.

User Support: A robust system is essential for addressing user queries, troubleshooting issues, and guiding the go-live and post-implementation phases. This can include dedicated support teams, knowledge bases, and self-service portals, ensuring that users can access the resources needed to use the ERP system effectively.
