

Oracle Transportation Management (OTM) at Sun Pharmaceuticals

Background and Objectives

Sun Pharmaceutical Industries Limited (SUN), a prominent player in the pharmaceutical industry, recognised the need to streamline its logistics and transportation processes through technology interventions.

This initiative’s primary objectives were to optimise:

 The cost of serving	 Enhance stock availability	 Improve service levels	 Achieve on-time in-full (OTIF) targets
--	---	---	---

Key Challenges and Considerations

Challenge	Description
Manual Processes	Order prioritization, inventory allocation, and route planning were done manually, leading to inefficiency and potential errors.
Batch Size Requirements	The need to manage varying batch sizes added complexity to logistics planning.
Reefer Requirements	Specialized requirements for refrigerated transport (reefer) added another layer of complexity.
Cross-Docking Needs	The necessity for cross-docking, where products are directly transferred from incoming to outgoing trucks, required careful planning and coordination.
Varying Vehicle Utilization	Different vehicles had different capacities and utilization needs, complicating the route planning process.
