

The project’s scope encompassed the movement of materials from plants to distribution warehouses and subsequently to clearing and forwarding agents (CFAs) and depots across India.

The key focus areas included contract management, logistics planning, and leveraging the capabilities of Oracle Transportation Management (OTM), the chosen Transportation Management System (TMS).

Challenge	Description
Lack of Supplier Performance Monitoring	There was no system in place to monitor supplier performance, making it difficult to ensure consistency and reliability.
Absence of Route-Specific Contracts	Contracts for specific routes were lacking, which could lead to inconsistencies and higher costs.
Need for Spot Contracts	Urgent orders often required spot contracts, adding to the operational complexity and increasing costs.
Importance of TMS Implementation	These challenges highlighted the need for a Transportation Management System (TMS) to streamline operations and enhance visibility across the extended value chain.
