

The OTM Implementation Approach

Deloitte, the consulting firm tasked with the OTM implementation, adopted a structured approach tailored to SUN’s requirements. The approach, based on Deloitte’s Momentum methodology, spanned several phases:

Baselining the current state involves understanding the existing logistics processes, estimating the total logistics cost, and identifying opportunities for cost reduction

Redefining the logistics process: Redesigning the logistics processes, detailing the changes to be implemented, and initiating the roll-out of quick wins.

Aligning with OTM functionalities involves reviewing the current state against OTM functionalities, identifying potential constraints, and addressing fit gaps.

Developing a blueprint: Creating a business blueprint for the to-be process, aligning with OTM functionalities, and developing technical blueprints for interfaces and integration with other solutions.

Pilot run: Defining the team structure, metrics, roles, and responsibilities, conducting functional and technical discovery sessions, configuring and prototyping the solution, and performing various testing phases (prototype, systems integration, and user acceptance).

Deployment: Final cutover, end-user training, post-implementation support, and readiness for go-live.

Enhancement: Roll out the solution to other locations, implement additional functionalities, estimate cost benefits, and monitor progress.

The implementation approach was augmented by Deloitte’s OTM and logistics transformation expertise, which leveraged project accelerators and industry-specific best practices gained from previous engagements in the pharmaceutical, consumer products, and manufacturing sectors.
