AI-Assisted Chess Training

Chess, a game renowned for its complexity and strategic depth, has long been a fertile ground for applying artificial intelligence (AI) technologies. While AI systems have already demonstrated their ability to outperform human grandmasters in chess, they are also proving to be invaluable tools for training and improving chess players’ skills.

AI-assisted chess training leverages AI systems’ computational power and vast knowledge base to provide chess players with personalised training experiences and strategic insights. These AI systems are trained on:

- Massive databases of historical chess games
- Opening moves
- Endgame scenarios

enabling them to analyse and evaluate countless potential moves and positions.
