

Demand Forecasting in the FMCG Industry

In the Fast-Moving Consumer Goods (FMCG) industry, accurate demand forecasting is crucial for effective inventory management, production planning, and Supply chain optimisation.

Traditional forecasting methods rely on analysing historical sales data using statistical algorithms and time-series models. However, these methods often fall short when accounting for external factors that can significantly impact demand patterns.

This is where AI can play a transformative role. By leveraging machine learning algorithms and advanced data analytics, AI-driven demand forecasting solutions can incorporate a wide range of variables beyond just historical sales data. These variables may include weather patterns, economic indicators, consumer trends, promotional activities, and even social media sentiment.

Variables

Weather patterns

Economic Indicators

Consumer Trends

Promotional Activties

Social Media Sentiment

For example, an AI system can analyse weather data to identify how temperature fluctuations or extreme weather events might influence the demand for certain products, such as beverages or seasonal items.
