

Anticipating the Evolution of AI in Consulting Practices

Generative AI and Large Language Models (LLMs)

Generative AI models, such as OpenAI’s GPT-3 and Google’s LaMDA, have demonstrated remarkable capabilities in generating human-like text, code, images, and other forms of content.

As these models continue to improve, they will revolutionise content creation, data analysis, and decision support in consulting practices.

Multimodal AI

Traditionally, AI systems have focused on processing and understanding a single modality, such as text or images.

However, the emergence of multimodal AI models that can process and integrate information from multiple modalities (e.g., text, audio, video, and sensor data) will enable more comprehensive and contextual analysis and decision-making.
