Behaviour Alignment: Shaping AI to Human Values

Effective behaviour alignment becomes paramount as generative AI systems become increasingly sophisticated and pervasive. IBM's research efforts in this domain are centred on developing cutting-edge techniques for selecting, intervening, fine-tuning, and aligning AI behaviours with human values and societal norms.

One of the flagship initiatives in this realm is the Pyrite project, which aims to demonstrate lifelong adaptation with episodic memory. This groundbreaking capability is slated for unveiling at Think 2024, showcasing IBM's prowess in enabling AI systems to learn and adapt continuously while retaining a contextual understanding of their experiences.

The Alignment Studio's contextual orchestrator and multi-objective training capabilities are poised to be delivered to IBM's inner source and Watsonx roadmap, further enhancing the platform's ability to align AI behaviours with diverse and sometimes conflicting objectives.

IBM's Generative AI Technology and Expertise

IBM's generative AI offerings are built upon a robust foundation of technology and expertise, encompassing a diverse range of solutions and services tailored to meet the evolving needs of enterprises.

AI Assistants: IBM's generative AI assistants, such as Watsonx Code Assistant, Watson Assistant, Watson Orchestrate, and Watsonx Orders, are designed to empower individuals across various business processes and applications, enabling them to perform tasks without the need for expert knowledge.
