

SDKs and APIs

IBM’s generative AI platform can be seamlessly integrated into third-party assistants and applications through a suite of SDKs and APIs, fostering a vibrant ecosystem of integrations and enabling enterprises to leverage the power of generative AI within their existing workflows.

AI and Data Platform

At the core of IBM’s generative AI offerings lies Watsonx, a robust platform that combines generative AI and machine learning capabilities with unparalleled data governance, transparency, and explainability. This platform is underpinned by a diverse array of foundation models, including IBM’s proprietary Granite model, open-source models from the Hugging Face ecosystem, Meta’s Llama 2, and specialised models tailored for geospatial applications in collaboration with NASA.

Data Services

Recognising the critical importance of high-quality data in training and tuning AI models, IBM offers data fabric services through Cloud Pak for Data and Watson Discovery. These services enable organisations to define, organise, manage, and deliver trusted data, ensuring their generative AI solutions are grounded in accurate and reliable information.

Hybrid Cloud AI Tools

IBM’s commitment to open innovation is exemplified by its hybrid cloud AI tools, built upon a consistent, scalable foundation based on open-source technologies such as Red Hat OpenShift AI, PyTorch, and Ray. These tools empower enterprises to develop and deploy generative AI solutions across diverse cloud environments, fostering flexibility and seamless integration with existing IT infrastructures.
