

INTERNAL VS EXTERNAL ANALYSIS FRAMEWORK

The Internal vs. External Analysis framework is a comprehensive approach for evaluating an organisation's internal strengths and weaknesses, external opportunities, and market-imposed threats. This framework is widely used in consulting projects to holistically understand a client's business situation and develop effective strategies that leverage internal capabilities while addressing external challenges.

This framework is crucial because it recognises that a company's success is influenced by internal factors (such as operations, resources, and competencies) and external factors (such as market trends, customer demands, and competitive landscape).

By analysing both dimensions, consultants can identify areas of alignment or misalignment between a company's internal capabilities and the external market realities, enabling targeted strategies and recommendations.
