

Notes

Step 2: Select the Appropriate Framework

After clearly understanding the challenge, the next step is identifying the framework that best aligns with the problem domain.

This decision should be informed by factors such as the nature of the challenge, the industry or sector, and the desired outcomes. Consult with colleagues, mentors, or industry experts to ensure you make the most suitable choice without hesitation.

For example, if the client faces organisational culture and employee engagement challenges, a framework like the Denison Organisational Culture Model or the Competing Values Framework may be appropriate. These frameworks assess and shape organisational culture, values, and behaviours.

In contrast, if the client's primary concern is optimising their supply chain operations, a framework like the SCOR (Supply Chain Operations Reference) model or the CPFR (Collaborative Planning, Forecasting, and Replenishment) model might be more suitable, as these are designed to analyse and improve supply chain processes and collaboration.

It's important to remember that while frameworks provide structure and guidance, they should not be treated as rigid templates. Effective consultants understand the importance of adapting and customising the framework to the unique circumstances of each engagement.
