

As an example of Absolute Referencing, there are 6 students in school: Samuel, Rakesh, Aparna, Kavita, Rajesh and Mayank

They have different quantities of toffees each in their shopping cart.

The price per toffee is INR 15.

We want to calculate the total price of toffees.

The price's reference is E10, we do not want the fill function to change this, so we lock it.

The reference is absolutely locked by using the formula $\$E\10 .

	A	B	C	D	E	F
1						
2				Student	No of toffees	
3				Samuel	3	
4				Rakesh	10	
5				Aparna	12	
6				Kavita	5	
7				Rajesh	7	
8				Mayank	9	
9						
10				Price	15	
11						
12						

	A	B	C	D	E	F	G
1							
2				Student	No of toffees	Total Price	
3				Samuel	3	45	
4				Rakesh	10	150	
5				Aparna	12	180	
6				Kavita	5	75	
7				Rajesh	7	105	
8				Mayank	9	135	
9							
10				Price	15		

A relative reference refers to a changing point of reference, where the return value changes depending on where the cell or formula moves to. Assuming the idea is to sum up the numbers, in the formula of D3 enter "=" (the equal sign) then select the point of reference – Cell C2 and D2

	A	B	C	D	E	F	G	H
1								
2				15	25	35		
3			10	25	35	45		
4			20	35	45	55		
5			30	45	55	65		
6								
7								

Using absolute and mixed referencing allows the creation of formulae that can dynamically adapt when replicated across cells - an extremely powerful capability for analysis.
