

The triangle has two minor highs and three minor lows, all of them touching (or coming close to) their respective trendlines. Price crosses the pattern from top to bottom enough to fill the whitespace.

The two trendlines intersect and the triangle stands alone. By that, I mean it is not part of another pattern. Or is it? The left peak (the first peak in January) in conjunction with the first minor high in the triangle might mark the beginning of a double top (or, if you include the second, lower, peak in January, it might be a triple top). Since price does not fall below the lowest low between the two peaks (in early February, at the bottom start of the triangle) before reaching a higher high (in March), the pattern does not confirm and is not a double (or triple) top.
