

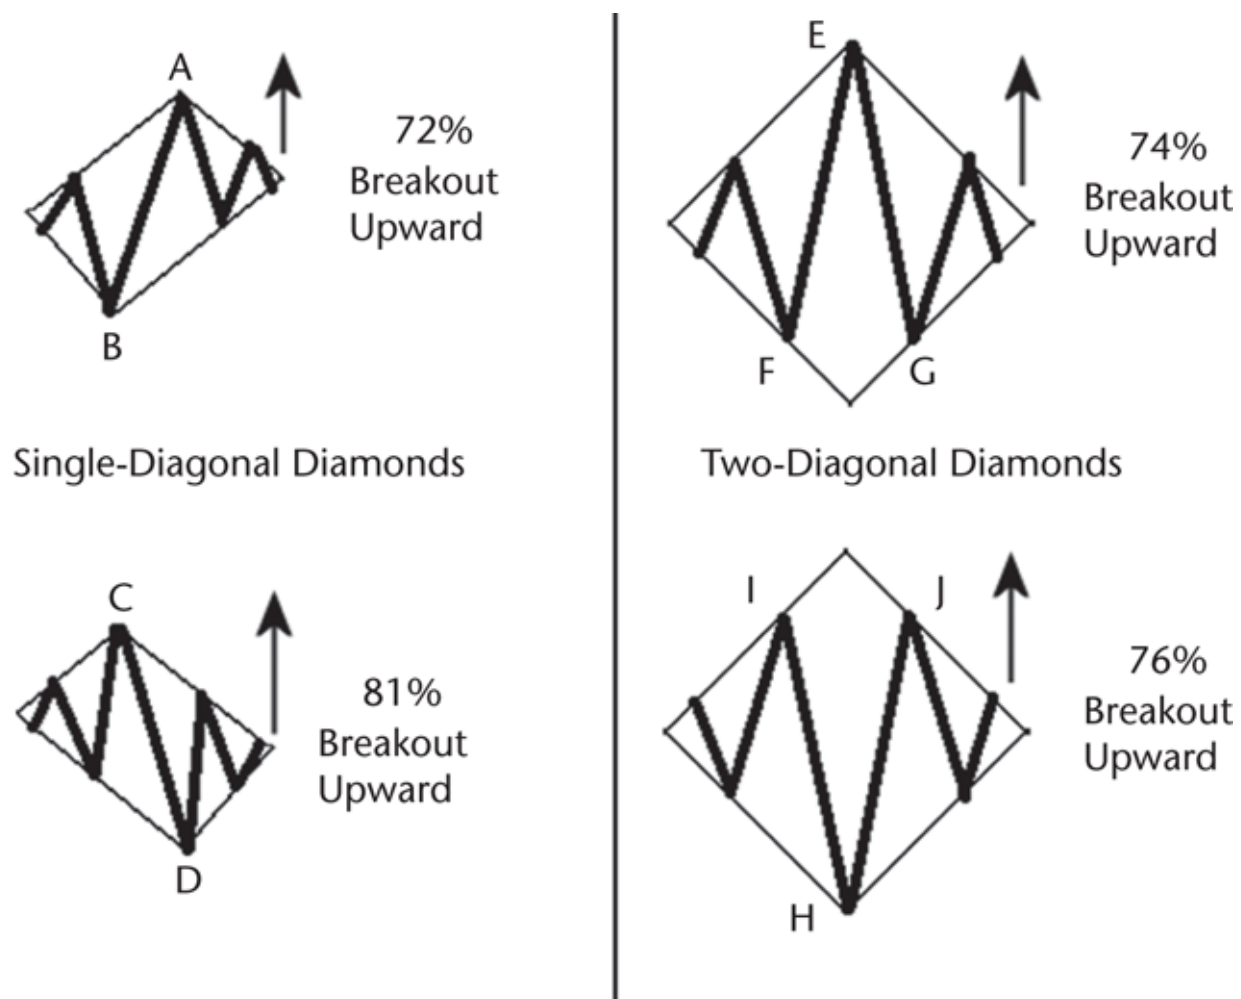

**Figure 24.6** The predicted breakout direction for diagonal diamond patterns.

I sorted the diamonds into single- and two-diagonal shapes and sorted by whether the top or the bottom of the pattern came first. The configuration shown at AB in the figure, where it's a single diagonal with the bottom coming before the top, is supposed to break out downward. I found that worked 58% of the time. That's better than the benchmark's 54%, but it's too close to random for my taste.

Configuration CD in [Figure 24.6](#) shows a single diagonal with the bottom coming after the top. His technique says these types of diamonds break out upward. Indeed they do 65% of the time compared to the benchmark's 46% of the time. That's a significant improvement.

**Two-diagonal.** For two-diagonal patterns, I checked whether the top or bottom came first and checked the breakout direction. The benchmark rate
