

the Eve & Eve pattern failed to rise was overhead resistance coupled with a deteriorating fundamental picture.

I like to know what is going on in the stocks I follow. I keep a database of events and can match an event to the price action. The company released earnings on both sides of the April/August price bump. The first release helped power price up, and the second helped cut it down. During creation of the Eve bottom, news appeared that machine tool orders were soft (down 2%) month-to-month and down 30% from the prior year. Coupled with increased foreign competition and insider selling, the fundamentals were turning bad. That information did not help the technical picture.

Statistics

[Table 29.2](#) shows general statistics.

Number found. I found 1,093 patterns in 675 stocks from September 1991 to February 2020. Not all stocks covered the entire period, and some stocks no longer trade. Because bear market samples didn't rise to the threshold I set for this edition, I don't include them in this presentation. That's why I show fewer than 1,000 patterns in the table.

[Table 29.2](#) General Statistics

Description	Bull Market
Number found	952
Reversal (R), continuation (C) occurrence	100% R
Average rise	50%
Standard & Poor's 500 change	13%
Days to ultimate high	222
How many change trend?	61%

Reversal (R), continuation (C) occurrence. Because price enters the chart pattern from the top and exits out the top, the pattern acts as a reversal of the downward price trend, by definition.

Average rise. The average rise in bull markets is one of the better performances I have seen for chart patterns.
