

storage, pop out each set of frozen product and transfer to a specific gallon-sized freezer bag. In the past, I've routinely had gallon bags of tomato sauce cubes, herb cubes, and cubes of chicken stock in the freezer at the same time.

Each regular-sized cube holds two tablespoons of liquid. This means that 2 cubes equals $\frac{1}{4}$ cup, 4 cubes equals $\frac{1}{2}$ cup, etc. This comes in really handy when recipes call for a specific amount of liquid for a recipe.

Putting the effort into this is worth the time. A gallon freezer bag of cubes lasts a reasonably long time, depending on how often you use the product, and provides an enormous savings of time as well as money. Also, considering all you need to do is ladle the liquid into the trays and freeze, it's not a great deal of time to begin with.

8 Natural Ways to Make Water More Flavorful

Many packaged drinks are quite expensive and the cheapest drink out there is water. The main reason that people don't drink water is that it is tasteless and not very "fun" to drink. On the other hand, water is definitely more healthy than soda, so now there is an entire category of packaged drinks that is basically bottled water with added coloring, vitamins, and flavor. Instead of buying these drinks, there are many things you can add to water at home to make it more exciting to drink.

1. Salt

I am sure you have heard of the term "electrolytes" in the marketing for energy drinks. Electrolytes are actually just ions that can be found in common table salt. Adding a little bit of salt to water helps your body absorb the liquid more quickly. As long as you don't go overboard with the salt, the water should be very quenching.
