

goes off they have to get out. Amazingly it only took a short while for them to be trained. They don't need the timers anymore; they wash and get out when they need to.

—Jessica, CT

2. DO LESS LAUNDRY

I don't know about you, but we easily get into the habit of wearing clothes or using towels only once, then immediately throwing them in the hamper to wash. But when we consciously take the time to go through each piece to see if we can indeed wear it (or use it) again, we find that almost half of that pile doesn't need to be laundered at all. More laundry = more water usage, and less laundry = more savings!

The other key is to wash laundry at the most optimal settings, meaning don't do extra large loads when you only have a few items to launder. Make sure every load is full, or adjust water levels accordingly. Laundering most clothing items in cold water is a good habit to get into as well. It might not save on water usage, but it *will* save on the electricity or gas used to heat your water.

3. PRACTICE DAILY HABITS

Besides shorter showers, and wearing clothes more than once, here are a few more daily habits that help reduce water usage:

- Use one drinking glass per day to cut down on the amount you have to wash.
- Keep a pitcher of water in the fridge to use, rather than let it “run” until cold.
- Water plants in the morning to create less evaporation.
- Don't run the dishwasher unless it's fully loaded.
