

Transports, at 93%, though the latter average accomplished the entire decline in 3 years (1929-1932), while the bear market in the DJUA took a Fibonacci 13 years (1929-1942).

The first Supercycle degree decline within the Grand Supercycle bear market that began a year and a half ago is also likely to take the form of a zigzag. Because the bear markets in the DJIA and DJUA that began in 1929 ended ten years apart, there is some uncertainty as to whether their upcoming Supercycle degree lows will coincide. However, there is little uncertainty about where the Dow Jones Utility Average will ultimately fall.

Reflecting the situation in all the other averages, long term support for the DJUA is in the area of Supercycle wave (IV), which spanned a range from 10.58 to 144.61. In contrast to the Industrials' and Transports' stretched-to-the-limit reflection of wave V, the DJUA failed to reach the upper parallel of its Supercycle wave (V) channel, as you can see in Figure 7-5. As a result, the index is particularly vulnerable to falling to the *lower* end of its support range. Furthermore, this Grand Supercycle bear market should carry the index down *further* than the 92.68% drop in the Supercycle decline of 1929-1942. 92.68% from the recent high of 256.46 is 18.76. Because this level is so close to the *low* of wave (IV), which is an excellent target in its own right, I will forecast that the Dow Jones Utility Average will ultimately fall very close to **10.58**, which is a loss of 95.87%.
