

this value would be maintained. That belief emptied the pockets of countless traders who for thirteen years after the initial jump in the ratio in 1980 (see Figure 17-8) continued to bet that silver would begin outperforming gold any day because the gold/silver ratio was "too high." Throughout this time, *The Elliott Wave Theorist* maintained that despite the dramatic change, silver was *not* a better buy than gold because its bear market pattern continuously portended a more severe decline. Indeed, by 1993, silver had fallen 93%, far outpacing gold's drop of 66.53%, or $\frac{2}{3}$, in the same period, bringing the ratio from 17:1 to an all-time record high of 100:1. (Had the gold/silver ratio remained 17:1, gold would have sold for \$60/oz. in 1992-1993 when silver reached \$3.50.)
