

To conclude, until the peak of wave (E) is in, allowing a final adjustment, **\$112** remains the most attractive target for the final low. **\$182** is the next most attractive target, which, if it does not mark the final low, has an excellent probability of marking a Primary degree low on the way down. All targets listed herein should be given a few dollars' leeway. Also, they are based upon the London fix prices, which would be exceeded somewhat by intraday futures prices.

Time Considerations

As you can see in Figure 17-12, Fibonacci durations have been evident throughout the period of free market trading in gold. The **13-year** advance from 1967 to 1980 subdivides into two periods of **8** and **5** years at the December 31, 1974 peak, which preceded the largest correction of the bull market. Since the bear market began, every major wave has terminated a Fibonacci number of years from the all-time high. From 1980, **2** years later was the low of wave W, **3** years later was the high of wave (A), **5** years later was the low of wave (B), **8** years later was the high of wave (C), and **13** years later was the low of wave (D). Wave X has taken its time so that it can last **13** years from the 1982 low.
