

target for the end of a pattern. Research shows that when they do, the exercise attains some forecasting value.

Fibonacci Numbers Of Years

Our 1978 book, *Elliott Wave Principle*, pointed out that **1987** reflected the most impressive cluster of Fibonacci time projections from previous turning points, and therefore was scheduled to contain the most important turning point of the decade. That year is **55** years from 1932 (the start of the Supercycle), **21** years from 1966 (the end of wave III), **13** years from 1974 (the start of wave V) and **5** years from 1982 (the year of the bull market lift-off). In 1982, with these durations in mind, *The Elliott Wave Theorist* predicted that 1987 would mark the final high of the bull market.

One reason why Supercycle (V) was expected to last 55 years is that so many of the Supercycle degree turning points that had already been established were close to a Fibonacci number of years apart. Here is the list, with the nearest Fibonacci number in parentheses (see Figure 4-1):
