

low of 1722 was reached 2 years after the peak of 1720. In Supercycle wave (II), the price low of 1842 was met 7 years after the top of 1835, while the low of 1857 was reached 5 years after the wave B peak of 1852. In Supercycle wave (IV), the price low of 1932 was reached 3 years after the price peak of 1929, while the low of 1942 was reached 5 years after the wave B peak of 1937.

Given the tendency of the market in those prior instances to decline for a relatively short period of time and to decline for a Fibonacci number of years, we can reasonably expect the first major bottom of Grand Supercycle Four (and possibly its price low) to be registered between 2 and 8 years from the top. Since 1995 is the latest probable year for a top as argued in Chapter 4, and since 8 years is the longest probable time for the initial decline in the bear market, then the year 2003 is indicated as the *last likely year for a bottom*, exactly as suggested by the most reliable fixed-time cycles (see Appendix B).

From a presumed 1995 peak, Fibonacci numbers point to the following years as possibly providing turning points within the bear market:

1995 + 3 years = **1998**;

1995 + 5 years = **2000**;

1995 + 8 years = **2003**.

Needless to say, while the time *lengths* of 3, 5 and 8 years will remain valid estimating distances from whatever year the final high is recorded, these specifically projected dates are dependent upon 1995 being the year of the top. If it proves otherwise, these distances will have to be adjusted forward accordingly.

The inflation-adjusted Dow also indicates an important turning point around that time, as shown by the following Fibonacci time spans, illustrated in Figure 5-10:

— The end of wave (II) in 1859 + **144** years = **2003**.

— The end of wave (IV) in 1948 + **55** years = **2003**.

— The end of wave (V) in 1966 + **34** years = **2000**.

— The end of wave A in 1982 + **21** years = **2003**.

These lists of dates unequivocally support the years **1998**, **2000** and particularly **2003** as probable years for the first major bottom. Strengthening these dates yet further, 2003 corresponds to a major cycle low, 1998 corresponds to smaller cycle low (see Appendix B), and 2000 is a Fibonacci 13 years after the crash year of 1987. It is possible that like our earlier projections for tops in 1983, 1987 and 1990, all three of these years will mark lows.
