

Figure 5-11

.382 times as long as the preceding wave V and 2.618 times as long as 1929-1932, or 8 years. From 1995, this duration would project a low in 2003. Figure 5-11 is notated to show that a low at that time could mark the end of the entire Grand Supercycle bear market or only wave (A). The 1932 low was both the end of a Supercycle bear market (in dollar terms) and the end of Cycle wave A (in inflation-adjusted terms).

To conclude, a major low is still expected to fall within our long standing target time of 1998-2003 first suggested a dozen years ago in *The Elliott Wave Theorist* (see Appendix A of *Elliott Wave Principle*). The most strongly indicated specific year is 2003. This analysis should not be construed to mean that a longer decline is impossible. This is a “best guess” and should be treated accordingly.
