

Time Forecasting for the Next Major High

Three of the last four Kondratieff cycles (see Appendix B) saw inflation-adjusted stock market peaks 23 years (1722 to 1745), 33 years (1886 to 1929) and 20 years (1948 to 1968) after their lows. These durations are each close to a Fibonacci 34 and 21 years, deviating by up to two years. Wave (B), then, might last 19-23 years or 32-36 years. The former time is the more strongly indicated because the “21” year period governed two out of the three instances, one of which took place in the last Grand Supercycle bear market. Thus, if wave (A) bottoms in 2003, the next high has a chance of occurring in **2024 ± 2 years** (i.e., 2022-2026), and a lesser chance of occurring in **2037 ± 2 years** (i.e., 2035-2039). *This is not yet a forecast*, simply an advance indication of a possibility. Only if the market declines as expected and then rises into one of these times will it become a forecast.

Time Forecasting for the Second Major Low

If wave (A) ends early in the century, when will wave (C) bottom? *The Elliott Wave Theorist* offered its first estimate back in December 1986:

Once wave B is over in constant dollars, all the bear market structure will need for completion is wave C. Of course, that may only be the first A-B-C in a *double* three, and the bear market could continue with a net sideways series of ups and downs carrying as far out as the year **2057**.

The year cited above was based upon the projected ending date for the low of the next Kondratieff stock market cycle (see Appendix B), which is ideally due 54 years after the upcoming low is ideally due, in 2003.

As it happens, the Fibonacci time aspects of prior bear markets in the inflation-adjusted Dow support this projection. In both Supercycle corrections of the past two centuries, turning points came not in adjacent Fibonacci numbers of years, but at *alternate* Fibonacci numbers of years, i.e., skipping one Fibonacci number. From the 1835 peak of wave (I), **8** years marked the 1842 low for wave A (off by 1), and **21** years marked the 1857 low of wave C (off by 1), skipping the 13-year duration. From the 1929 peak of wave (III), **3** years marked the 1932 low for wave (IV), **8** years marked the high for
