

5 years, and wave IV, a sideways correction from 1966 to 1974, lasted 8 years, a Fibonacci relationship. There is an excellent probability, then, that wave Four will last between a Fibonacci $5/3$ and $3/2$ of the duration of wave Two.

As explained in Chapter 2, we are unfortunately hampered by the uncertainty of the data for the late 1700s. British stock prices show a low in 1784, completing a 64-year bear market. If wave Two ended in 1779 or 1788 (or in 1781 when adjusted for inflation) in the United States rather than in 1784 as in Britain, then the duration of wave Two could be as short at 59 years and as long as 68 years. Without putting too fine a point on it, we can conclude that wave Four will last about 1.618 times as long as wave Two, or about a century. This is also an excellent estimate for the *maximum* duration, since a century is about half of the time of the Grand Supercycle *advance*, and of the examples listed above, a 50% duration is the longest. It is also a *reasonable* relationship in this case, as the 50% duration was achieved by a sideways correction. A sideways correction of this duration would also meet the lower parallel line quite satisfactorily. From 1995, then, the bear market should end no later than the **2090s, plus or minus a decade**.

Supporting this time zone for a change in trend is the fact that a Fibonacci **144** years from the end of the Supercycle wave (IV) bear market in inflation-adjusted terms in 1948 is **2092**. A Fibonacci **233** years from the inflation-adjusted low of wave (II) in 1859 is **2092**. A Fibonacci **89** years after the low due in 2003 is also **2092**. (Once the date of the low due in the next decade is available, we can adjust this date if necessary.) All these durations are illustrated in Figure 5-10. The Decennial Pattern (see Appendix B) argues for a low in the first four years of each decade, with the *second* year the most strongly indicated, so 2092 date is strengthened by that cycle. Since durations of 89 years and higher have been off by as much as two years, and because the Decennial Pattern leaves open about the same leeway, we have a strongly indicated time for the end of the Grand Supercycle bear market of **2092 $\pm$ 2 years**. Perhaps the earliest year would be 2084, 89 years after 1995, and the latest year would be 2111, the projected time for the Kondratieff cycle bottom due after the one mid-century. Both of those dates will be subject to change upon verification of the year of the high and the time of the next two Kondratieff cycle bottoms.
