

Imagine, you have
1000 sales people
working for you.

Each salesperson sells 10 units of your product priced at INR 100. That means each salesperson earns INR 1000 for you.

If your 20% i.e. 200 salespersons are absent on a particular day then you lose sales of INR 200,000 per day.

This shows that absenteeism has a direct impact on the top line of the organization. Top line is the total gross revenue earned in a period of time. In case of non-sales employees, absenteeism indirectly affects the revenue and productivity of the organization.

Absenteeism is also a lead indicator for attrition. However, all types of absenteeisms do not result in attrition.
