Data Management

Data is of two types

Structured Data

The data is organized in a specific format, such as tables or databases, which makes it easy to search. For example, an employee database can be organized in an Excel sheet. This is the base for most of the HR Platforms.

Unstructured Data

Unstructured data may exist in various formats, including text, numbers, images, audio or videos. It is difficult to understand. However, it provides valuable insights into employee behavior and sentiments. You need artificial intelligence and machine learning systems to process unstructured data.

The data itself is not very useful. It needs to be processed to be meaningful. The DIKW model tells the method of enriching data to improve decision making.
