DIKW Model

Data is a collection of facts. In HR, data refers to employee demographic information (like age, gender, education, location etc.), attendance and performance.

Information is analysis of the employee data. Knowing “who”, “what”, “when” and “where”. In HR, information could be employees having low attendance and poor performance.

Knowledge is understanding “how” information is connected to other pieces of information. In HR, knowledge is knowing the factors which influence attendance and performance. These could be training or work life balance.

Wisdom is knowledge applied in action. When you know “Why” it happens and “What is the best?” That is wisdom. In HR, wisdom is to implement policies and programs to ensure job related training and work life balance to reduce absenteeism and improve performance.
