

Opinions, Data Points & Metrics

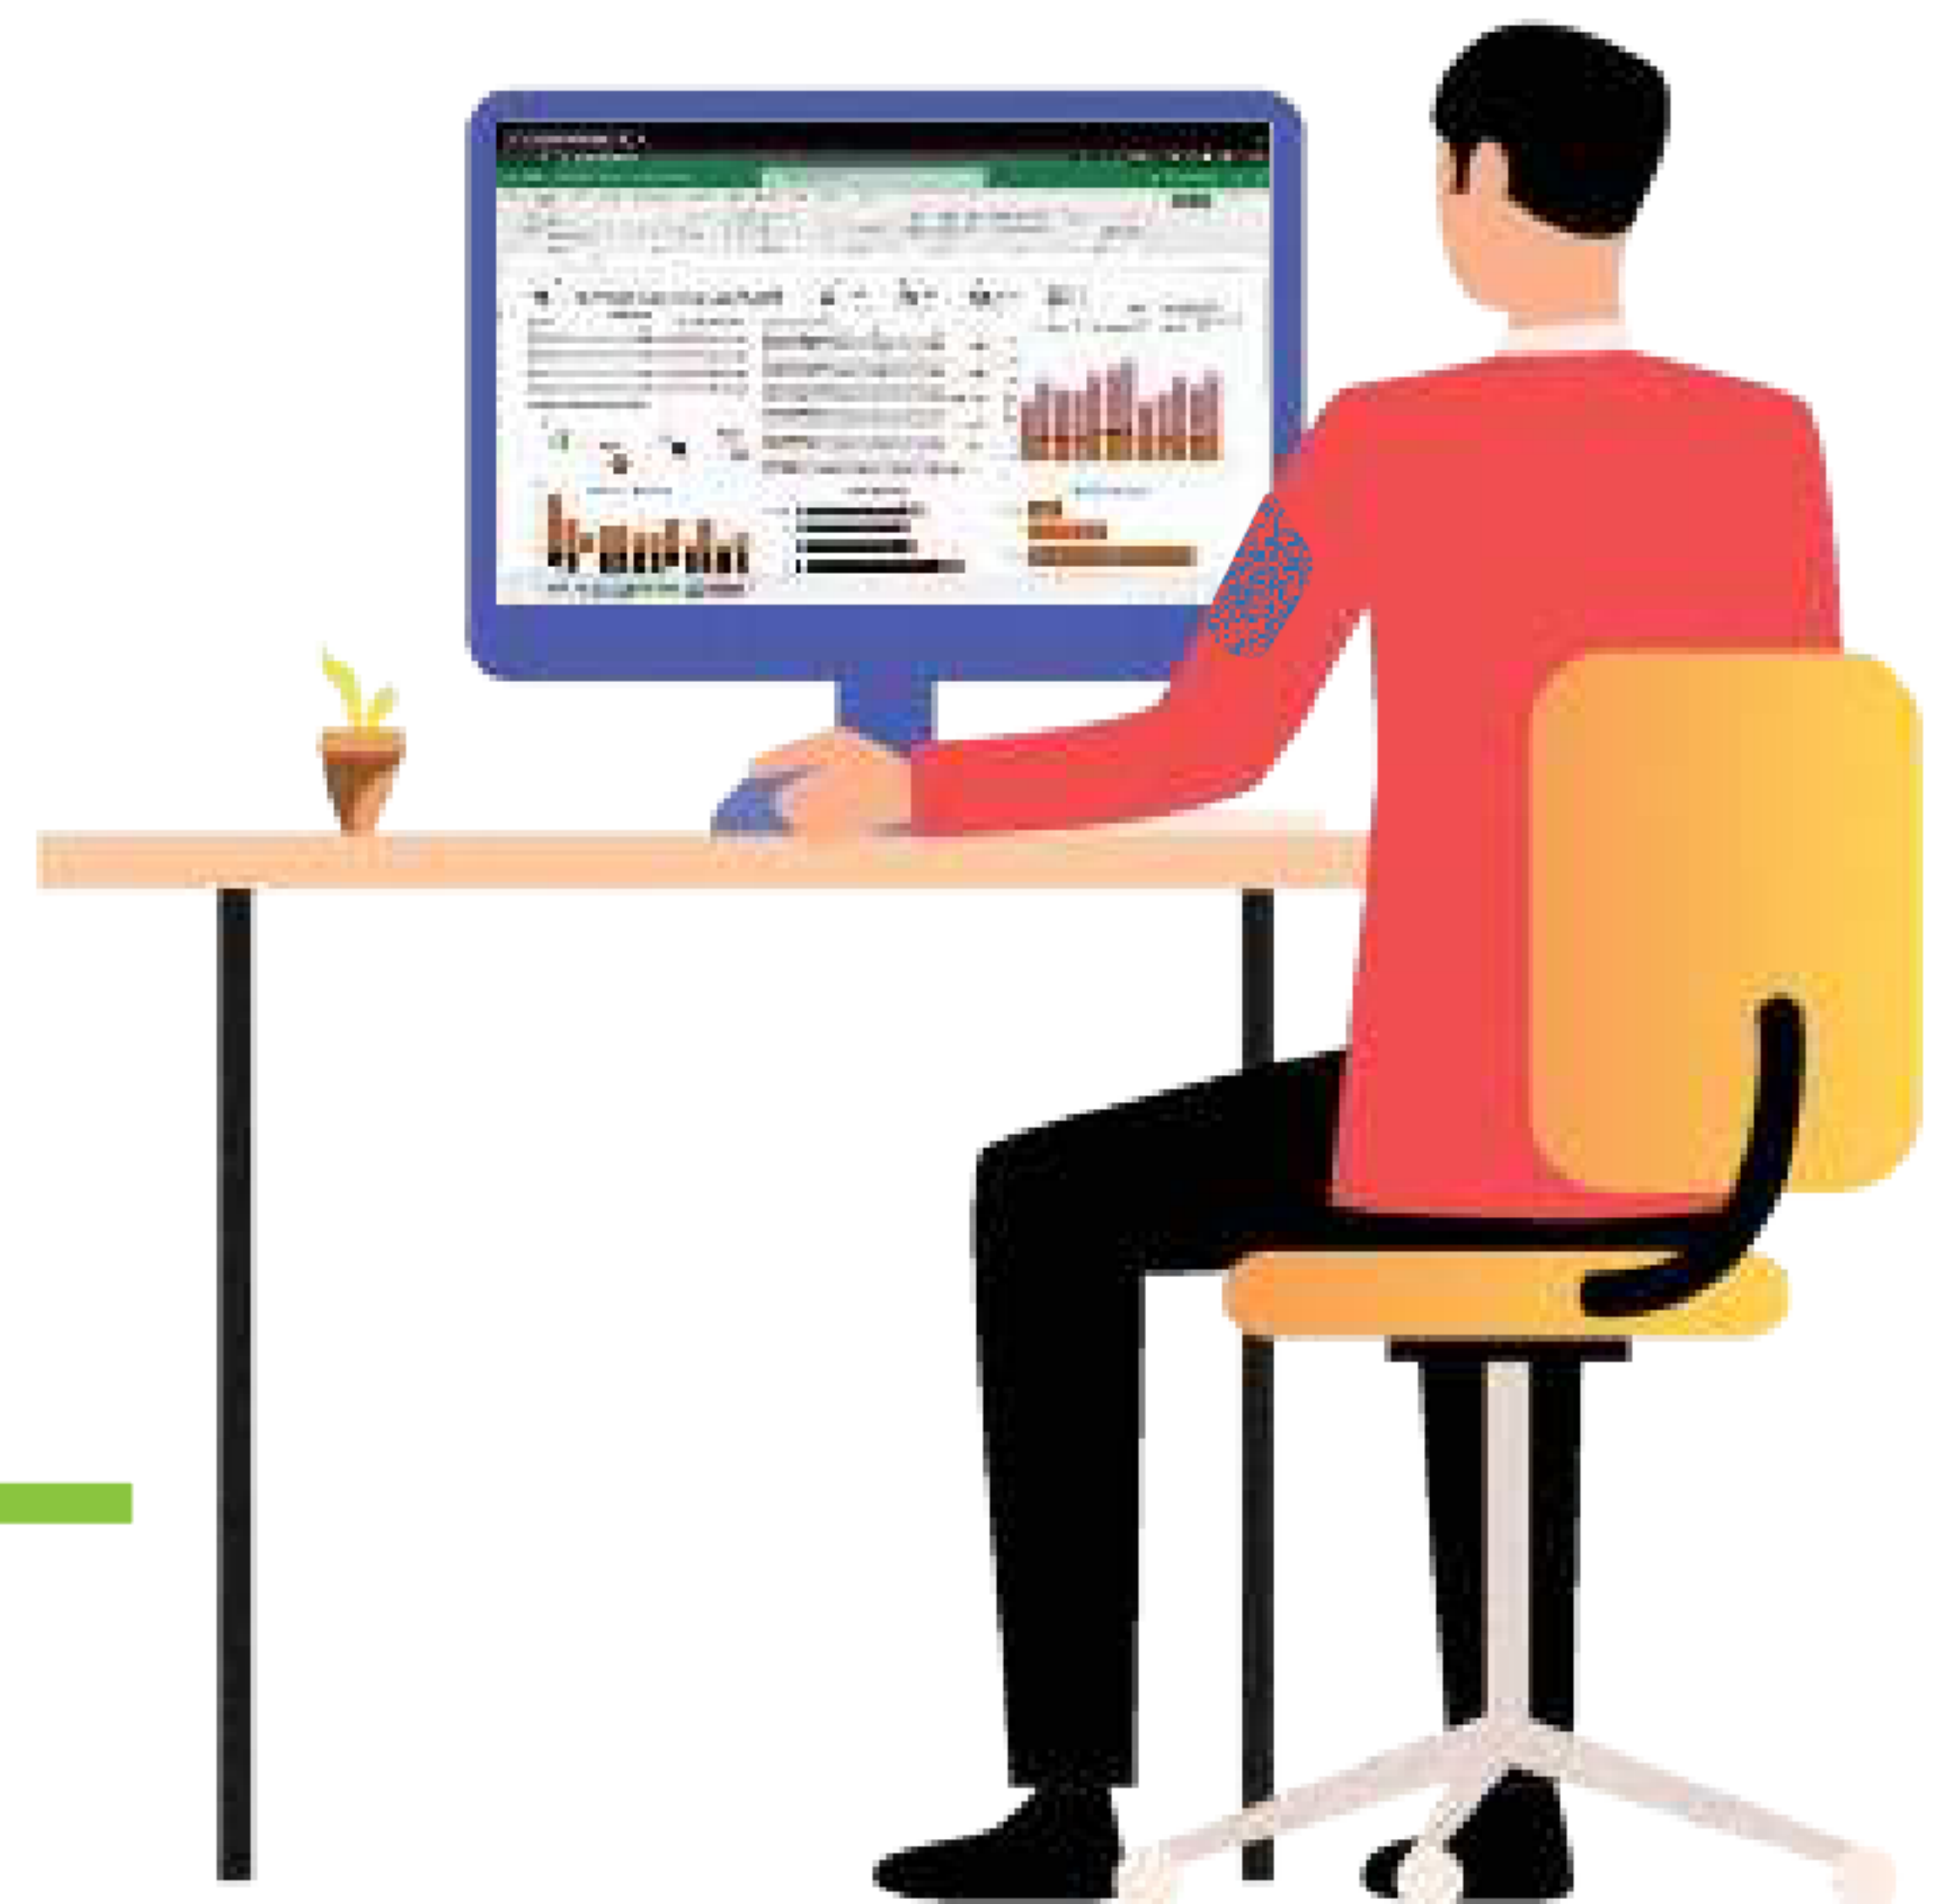

Do you know how many people are leaving the company?

Suppose, your colleagues tell you that a lot of people are leaving the organization.

This is an opinion.

You should validate opinions with data. You analyzed the data and found that the 7 people left.

This is a data point.

Data points are important but could be misleading. Here are two ways the data points could mislead.

Does data point tell you whether 7 people left in a day, month or a year?

Does data point tell you whether 7 people left out of 10 people, 100 people or 1000 people?

Add context to the data point, it becomes metrics. You should know how to use metrics.
