

How many metrics to measure?

You should measure metrics based on your requirements. Here are the metrics you may consider

Outcome measure

Measure the metrics that tell you the outcome. If you want to measure attrition, the outcome metric will be attrition rate. It is a lag indicator. You get to know about it when the attrition has already happened. You cannot control it.

Input measure

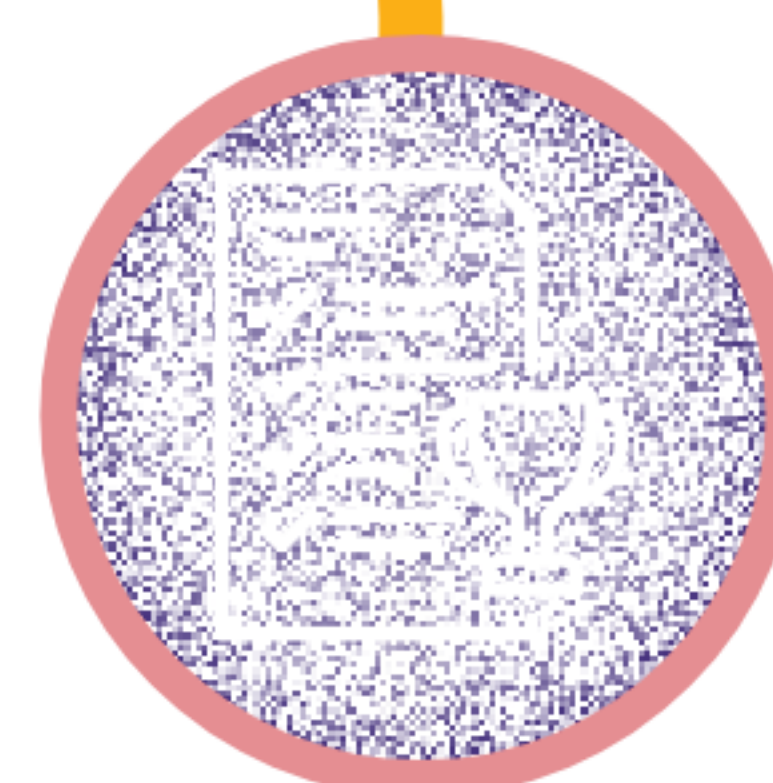

Measure the metrics that influence outcome. These are also called lead indicators. The lead indicator for attrition is employee satisfaction. If you know that employees are not satisfied. You still have a chance to prevent attrition.

The best practice is to use one output measure and upto 3 input measures.

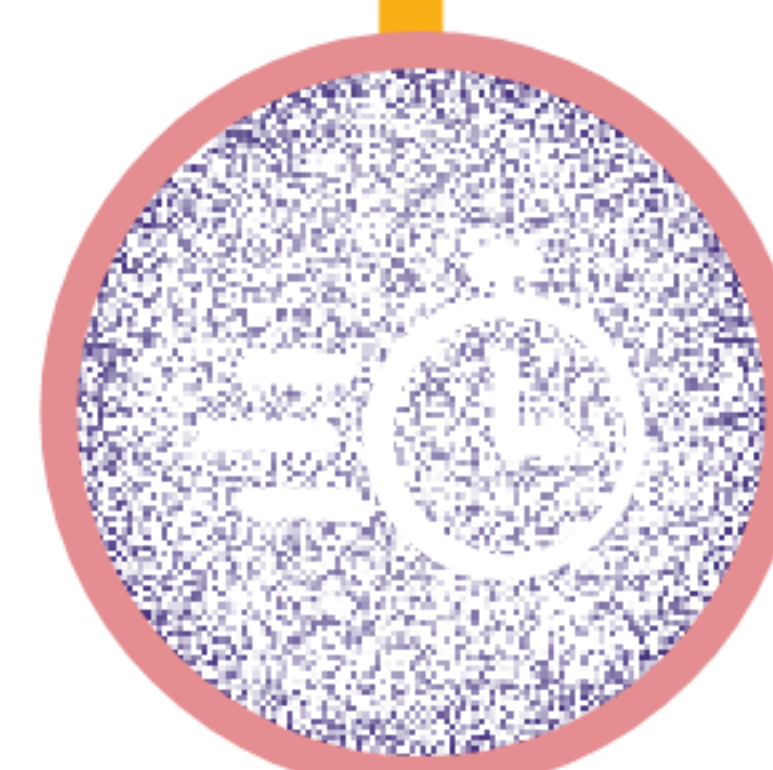

Although you know that there should be one output measure per outcome you may like to cover various aspects of an outcome.

Aspects to Measure

You may choose to measure different aspects of an outcome based on the requirement of the business. The aspects include

1. Outcome itself

2. Efficiency of the outcome (Speed)
