You may collect data for attrition and working hours. Regression analysis will create an equation between working hours and attrition. If they are related then change in working hours will change the attrition.

Then you will be able to predict the attrition by observing the working hours. You may even be able to control the attrition by controlling the working hours.

However life is not that simple.

Attrition may depend upon ten other factors including

You need to identify those ten factors out of hundreds of available factors. Regression analysis segregates the factors that affect your outcome from the factors that do not. Then you can perform predictive analytics.
