

Don't be surprised if you discover that you've only hired 10 individuals via a job search engine, with an average cost of 4 lakhs per candidate.

If you calculate the overall hiring cost per employee from various sources (Direct Search, Consultants, References) you will come to know which source is more effective. You may also decide to adjust the rates to make a source more effective.

2. Monitoring Performance

You may use analytics to monitor your HR operations. Suppose, you want to hire 80 frontline employees in one month. That means you need to roll out 100 offers assuming that 20% of people will decline your offer. That means you need to conduct 200 interviews to make 100 offers assuming that half of the candidates get selected in your interviews. That means you need to source 400 candidates if one out of two profiles is shortlisted for an interview.
