

Dashboards and Reports

Dashboards and Reports both present data analysis but they have different characteristics. You may choose them as per your requirement. The CHIEF differences between them are:

1. **Customization** - Reports are easily customizable whereas, dashboards require mapping with the backend databases.
2. **Hard work** - Reports require continuous hard work whereas, dashboards require effort only at the time of setup.
3. **Interactive** - Reports are static. They show data till the cutoff date. The dashboards can be dynamic and interactive. They can show live data.
4. **Elasticity** - Reports can use data that does not exist in databases whereas dashboards can't do that. You may add commentary and insights in a report.
5. **Frequency** - Reports are produced on a frequency (Daily, and Monthly) whereas dashboards are always available.

The effectiveness of reports and dashboards depends upon the design.
