

Designing a Dashboard

You should design a dashboard or a report using OSCAR principles.

1. **Ownership** - Define the ownership and the audience. Articulate the responsibility to review and take actions based on insights.
2. **Simplicity and Clarity** - Design for simplicity. Do not try to put too much of everything into it. It should communicate the message with clarity. The consistency of layout, colors and cohesiveness brings clarity.
3. **Context** - Provide the context of the dashboard or report. It must convey a message rather than showing data points or charts. Use background, references, trends and benchmarks to enrich the context.
4. **Accessibility** - Provide access on a need to know basis (only those who are required to know the information should get the access).
5. **Relevance** - Ensure that one individual should get all relevant information for doing the job at one place rather than referring to multiple dashboards or reports. Make them interactive wherever possible. You may make reports interactive by adding annexures.
