

In the End

You may build the reports and dashboards using various tools including Tableau, Excel sheets or Power BI. The major effort goes in

- 1. Designing them to provide meaningful insights.
- 2. Mapping data sources (where data will come for producing them.)

Analytics is not a static business. Since the external environment keeps changing. You need to keep iterating and improving your reports and dashboards. The challenge comes when the data is huge and the calculations are complex. However, that also has a solution. We will discuss the solution in the next chapter.

Context makes analytics actionable.

Hands-on HR

Here are some hands-on questions for you to apply what you learnt in this chapter.

1. Create Visualization

Study the following Headcount data for an organization for its four regions. The headcount should be between 120 to 190 for optimal operations.

Table 1: Headcount Table

Headcount	East	West	North	South
Jan	100	110	200	180
Apr	135	135	160	180
Jul	150	140	120	190
Oct	200	160	170	190

Create following based on the above data

- a. Prepare Heatmap showing when the headcount was not in the optimal range i.e. more than 190 and less than 120.
- b. Line chart - Create a line chart showing the trend of manpower in each region.
- c. Pie Chart - Create a pie chart showing distribution of headcount in four regions in the month of January.

You may use microsoft excel or google sheets for doing it.
