

Artificial Intelligence

Artificial intelligence (AI) is a branch of computer science that creates machines to perform tasks that require human intelligence. AI is perceived to do a better job especially because:

1. It processes mass transactions that are detail oriented and repetitive in nature.
2. It does not mind doing monotonous work without taking a break.
3. It is consistent and fast in processing.
4. It systematically shares valuable insights. These insights could be to enhance experience, improve quality or to detect frauds.

AI has replicated certain human skills for doing the better job.
