Skills of AI

The human skills replicated by AI include

1. Learning - Acquire data and create rules for processing the data. These rules are called algorithms. They provide step by step instructions to complete a task.
2. Reasoning - Find the right algorithm for solving a problem.
3. Self Correction - Improve the algorithms to improve the output.
4. Creativity - Generate new images, ideas, texts, videos and music.

AI has multiple disciplines. Each one focuses on a specific area to match human intelligence.
