

Will AI take away HR jobs?

This is a question that arises frequently whenever a new AI product is launched in the market. It is the same fear that bank employees had when computers were launched for the first time. They later realized that computers were meant to make them faster. The efficiency resulted in the loss of a few jobs. However, the total employee base of banks has doubled since then. HR will be no different. The transactional and repetitive jobs of HR will transform into more value-added jobs.

Apart from the concern of job elimination, there are other ethical concerns.

Ethical concerns

You must be sensitive to the ethical concerns surrounding AI. The key concerns include:

1. Bias

AI models are only as good as their training data. If bias is present in the training data, it can lead to discrimination and harm the organization.

Amazon scrapped its AI recruitment engine as it started discriminating women candidates.
